## 10 kWh of flywheel energy storage

How does a flywheel energy storage system work?

Flywheel Energy Storage Systems (FESS) rely on a mechanical working principle: An electric motor is used to spin a rotor of high inertia up to 20,000-50,000 rpm. Electrical energy is thus converted to kinetic energy for storage. For discharging, the motor acts as a generator, braking the rotor to produce electricity.

What is the energy storage capacity of a flywheel?

A steel alloy flywheel with an energy storage capacity of 125 kWh and a composite flywheel with an energy storage capacity of 10 kWh have been successfully developed. Permanent magnet (PM) motors with power of 250-1000 kW were designed, manufactured, and tested in many FES assemblies.

Can flywheel energy storage systems be used for stability design?

The flywheel energy storage systems can be used for stability design in high power impulse load in independent power systems [187,188]. A combined closed-loop based on the genetic algorithm with a forward-feed control system with fast response and steady accuracy is designed.

How can flywheels be more competitive to batteries?

The use of new materials and compact designs will increase the specific energy and energy density to make flywheels more competitive to batteries. Other opportunities are new applications in energy harvest, hybrid energy systems, and flywheel's secondary functionality apart from energy storage.
